THE WARRIOR RACE GROUP SPREADS IN EUROPE

[READ MORE...](#)

News

2014.08.27 | RESEARCH NEWS
Yellow rust in Europe: The Warrior race group has spread to new areas in 2014

New results from GRRC show isolates of the Warrior race group were present in high frequencies at many epidemic sites in Europe in 2014. Isolates of this race group were detected on many varieties of both wheat and tritcale, which confirm a high level of aggressiveness of such isolates.

- > [Summary of *Puccinia striiformis* isolate pathotyping 2010](#)

Sampling site focus in 2014 will be selected by staff at ICARDA, CIMMYT and NARS in Africa and Asia, with a focus on high risk epidemic areas. Since 2011, GRRC also accepted samples of stem rust (*Puccinia graminis tritici*) as agreed upon with the International Network for the Improvement of Wheat (INIW). Due to the INIW Project (DRAWI), GRRC can only process samples according to available space and resources at any time, and we cannot guarantee to process all samples received. This report deals only with yellow rust. Submission procedures are enclosed at the end of the report, 2012.

Hvede v/ Karise, 20. november 2013

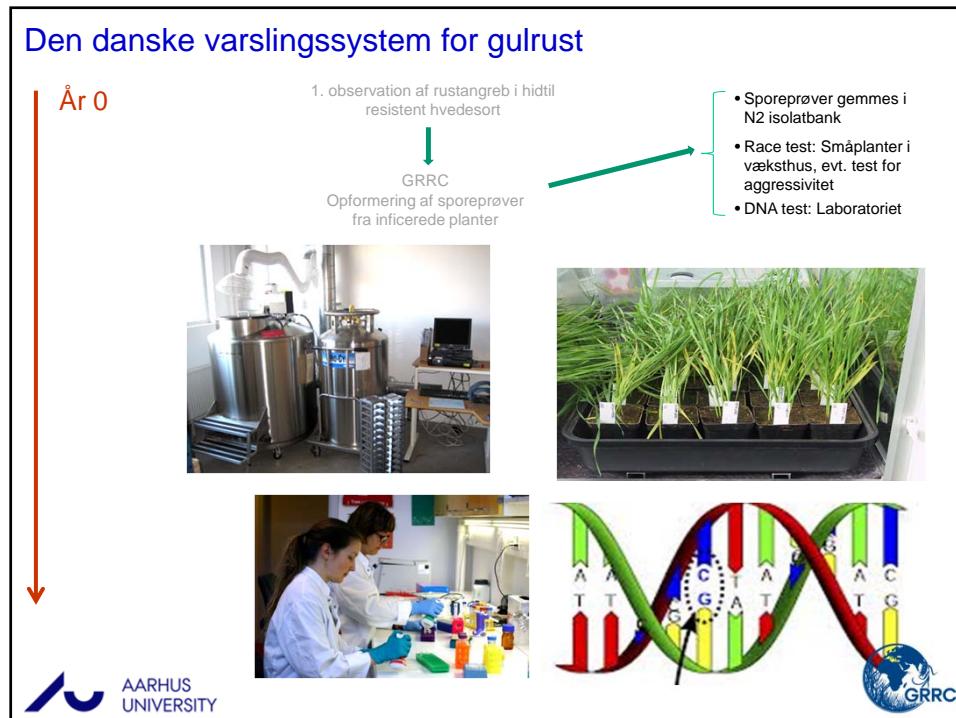

Angreb i den kommende vækstsæson?

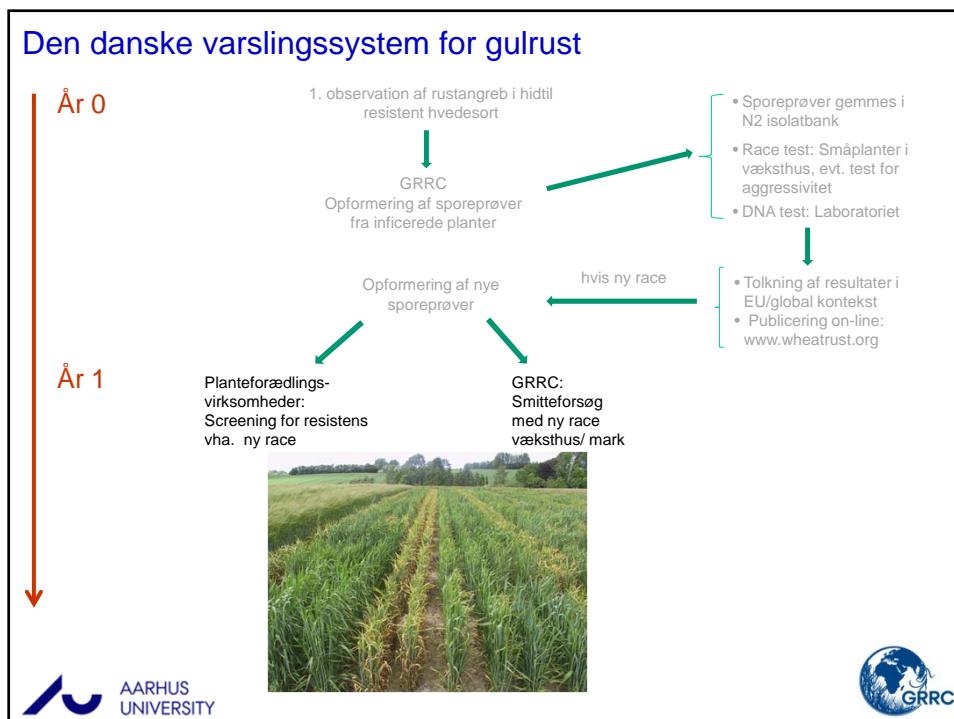

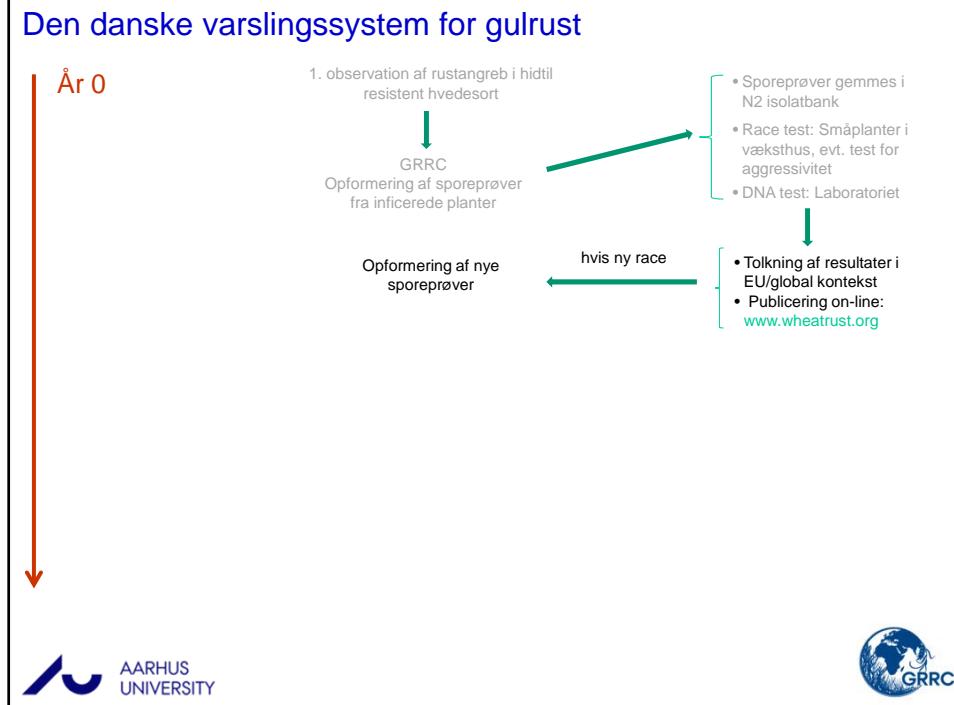

Primær infektion af gulrust ("læsion")

- Vinteroverlevelse: Afhænger af værtplantens 'overlevelse'
- Smitterisiko (sortsniveau): Afhænger af 'smitterace'
- Epidemisk potentiale: Afhænger af svampens 'aggressivitet'
- Afhænger af vækst/vejr-forhold og 'management' på markniveau og sortens resistens

PATHOTYPE BY COUNTRY

Data provided by: Institut National de la Recherche Agronomique (France), Julius Kuhn-Institut, Federal Research Centre for Cultivated Plants (Germany and Austria), National Institute of Agricultural Botany (United Kingdom) and Aarhus University (Denmark and Sweden).

AARHUS
UNIVERSITY

Genetic study: Origin and spread of new *Pst* races in Europe in recent years

Question 1:

Mutation/recombination within the existing European *P. striiformis* population

Question 2:

Does Warrior & Kranich races represent a recent invasion into Europe from the central Asian 2010 and onward epidemics?

Question 3:

What is the likely origin or the Warrior and Kranich races?

Methodology

Selection of isolates

Part A

- Representative isolates of the Warrior race 2011-2013 [Spain, France, Germany, United Kingdom, Denmark, Sweden]
- Representative isolates of non-Warrior races 2000-2010 [European origin]
- Representative isolates from epidemic sites in Central Asia 2010-2012 [Uzbekistan, Tajikistan]

Part B

- Reference isolates from global study representing 6 continents 2005-2010 (Ali et al., 2014) , including recombining populations from the Himalayan region “Center of diversity”

Methodology

Isolate characterization

Part A isolates

- Race phenotyped in national labs: France, Germany, UK
- GRRC: Denmark, Sweden, Spain, Portugal, Uzbekistan, Tajikistan some overlaps of isolates and differential seeds between national labs and GRRC
- SSR genotyped at GRRC/Uppsala, using 16 of 20 SSR markers from Ali et al., 2014

Part B isolates

- Genotyping results from Ali et al. 2014 (INRA-Grignon, France) aligned with results for Part A isolates

One common dataset developed

Virulence phenotyping (race) results – 34 differentials

- **Warrior:** One dominant race in 2011-2012/ another race increasing in frequency in 2014 (“Warrior non-Ambition”)
- **Kranich:** One dominant race 2011-2014
Both races: Small differences for specific differentials at the quantitative level
- **Triticale aggressive:** one dominant race 2006-2014, - and one virulence mutant detected (Sweden) – highly avirulent on Scandinavian winter wheat
- **Triticale non-aggressive:** One race - highly avirulent on wheat in general

Genetic study: Origin and spread of new *Pst* races in Europe in recent years

Question 1:

Mutation/recombination within the existing European *P. striiformis* population

No! Warrior, Kranich and Triticale races did not emerge from the pre-existing NW European *Pst* population – many alleles exotic to EU population

Question 2:

Does Warrior & Kranich races represent a recent invasion into Europe from the central Asian 2010 and onward epidemics?

No direct link but they share a number of alleles with central Asian population. Warrior & Kranich were not re-sampled in the post 2010 CA population

Question 3:

What is the likely origin or the Warrior & Kranich races?

Most related to near-Himalayan populations (“center of diversity”) but still divergent from these populations (Ali et al. 2014)

Exact origin: Will require much more detailed sampling efforts over huge areas and time points and many more markers representing the pathogen genome

Resume

Landmænd/rådgivning/sortsafprøvning:

- Varsling for ændringer i rustmodtagelighed – vigtigt med tidlig påvisning af nye racer
- Fælles ansvar for detektion af "usædvanlige" observationer, - og indsendelse af planteprøver med smitte til GRRC (efter altale)
- Publ. af resultater i SortInfo, Sortsforsøg, Planteavlisorientering, mm.

Planteforædling:

- Nyt forædlingsmateriale testes mod 'nye' racer hurtigst mulig
- Internationalt overblik via wheatrust.org

Forskning:

- Ny indsigt i rustsvampenes evolution og spredningsmønster på niveauer fra mark til kontinent
- Analyse af resistensegenskaber i korn og græs via adgang til global "isolatbank" (stor genetisk diversitet)
